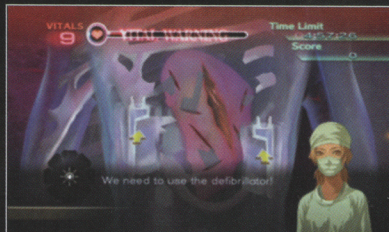
DEFIBRILLATOR

If a patient's heart stops, you'll need to restart it by sending an electric pulse through his or her body. The defibrillator paddles will automatically appear in such a situation.


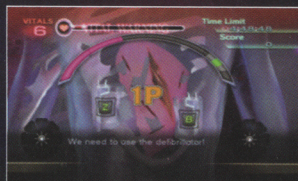
There are two steps to using the defibrillator.

1. Place the paddles on the patient's chest.
Move the Wii Remote towards the Sensor Bar to place the paddles against the patient's chest.

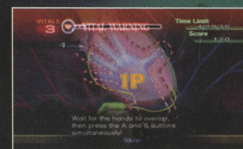
2. Send an electric shock.
Watch the voltage meter, and when it reaches the appropriate level (indicated in green and light grey), press the Z and B Buttons simultaneously (A and B Buttons if the Nunchuk is disconnected) to activate the charge.

If the charge is too weak or too strong, the patient's heart will not respond. You have a limited amount of time, so try to remain calm.

▼ Co-Op Mode

In Co-Op Mode, the two players will alternate controlling the defibrillator. Depending on the level of success the first player has, the other player may or may not have to give the patient a second jolt.


HEART MASSAGE

There will be situations when a patient's heart stops, and a defibrillator is not available. In these instances, you'll have to perform a heart massage.


Massaging a patient's heart requires careful timing: watch the outlines of the hands, and when they overlap, press the A and B Buttons simultaneously. You'll have to do this successfully a number of times to get the heart beating again.

▼ Co-Op Mode

In Co-Op Mode, the two players will take turns massaging the heart. Both players will need to do so properly in order to get the heart beating again.

ADDITIONAL TOOLS & MATERIALS

From time to time, you will need other tools and materials that are not part of your standard set of instruments and do not require the use of the forceps. These will be handed to you in a tray at the appropriate times during operations.

▼ Using Additional Tools & Materials

When a new tool or material is made available, you'll need to select it before you can use it.

Point the Wii Remote at the new tool or material on the tray, and press the A or B Button to pick it up. Then, it will be ready for use. Bandages are the most common material that fall into this category. See below for more details.

■ Bandage

After an incision has been sutured and the bleeding stopped, use a bandage to finish the procedure. First, pick up a bandage from the tray. Then, point to one end of the sutured wound. Press and hold either the A or B Button as you move the Pointer lengthwise across the wound, extending the bandage. You can control both the length of the bandage as well as the angle at which you apply it. Just release the button when you have positioned it as you like. Make sure it's not too short or too long, and try to center it over the incision area.

There are other tools and materials aside from the bandage. They're all used differently, so listen carefully to your assistant for advice on how to use them properly.
